

Special Cheats – Automated Codes

Some useful commands have been automated. Here are them :

- **Sample** : [here](#)

| Cheat Code           | Description                                                                    | Notes                                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \$SAFEMODE           | Disables the cheat engine and only activate it after POPS has left the PS OSD. | Should be always ON. Some game codes do patch the memory area where the PS OSD is loaded, causing crashes and other garbage...                                         |
| \$COMPATIBILITY_0x## | Activates a <a href="#">compatibility mode</a> .                               | ## is a hexadecimal value. You can write as many \$COMPATIBILITY_0x## as you want.                                                                                     |
|                      | For games that lag badly or stall randomly.                                    | If compatibility mode and mode 0x04 doesn't fix that doesn't fix your issue. Do not use it by default on all your games, because most games will stop working with it. |

May be needed by some discs that have a messed up LC protection.

Just for the records : value is \$S00033900000001.

Can be done using a **PATCH\_#.BIN** file. Not meant to convert NTSC games to PAL.

Useful for PAL VCDs that don't have a valid license text in their bootsector. Can be done using a [PATCH #.BIN file](#).

Not compatible with \$XPOS, \$YPOS,  
\$DWSTRETCH, \$DWCROP & NOT reliable  
ATM. See notes [here](#)

Does not deal with stuff like HUDs, texts/fonts, menus, 2D backgrounds... This hack is not finished (no render fix...).

Does not match any aspect ratio standard.  
Does not deal with stuff like HUDs,  
texts/fonts, menus, 2D backgrounds...

Does not deal with stuff like HUDs,  
texts/fonts, menus, 2D backgrounds...

#### is a number (decimal, negative values not supported). Works only in PAL and NTSC modes. Default value : 640.

Centers the screen  
vertically.

**##** is a number (decimal, negative values not supported). Works only in PAL and NTSC modes. Not working in OBT15, fixed in OBT16. No default value, depends on the game, you have to experiment. The higher the value is, the more the screen moves down. Not compatible with \$480p.

Stretches the display horizontally to your screen.

#### is a number (decimal). Works only in PAL and NTSC modes. Default value : 2559. Increase it to stretch the screen on the right, decrease it for the left. Not compatible with \$480p.

Reduces/expands the display area width.

#### is a number (decimal). Works only in PAL and NTSC modes. Maximum value : 2560. Decrease it to crop the screen on the right. Not compatible with \$480p.

Enables SetGsCrt hack.

Helps with the HDTVs that can't deal with the interlaced resolutions thru component (plain green screens and other rubbish displayed otherwise). Not compatible with some CRT TVs.

Enables the scanlines generator.

A scanline is a horizontal line, or row, in a raster scanning pattern, so that the image of the games are seen with this type of lines that the old TVs and tube monitors (CRT) had.

| \$UNDO_GAME_FIXES   | Prevents POPstarter from activating game fixes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | This comand may not work for some games to show their problems again, since during the end development of the latest beta, work was done fixing bugs to the POPS, and probably due to patching one of this bugs makes the game work well without needing the specific fixes for each game, (which seems to be the case of the game Crash Bandicoot game in its PAL version). Some game fixes were also removed (it is not remembered for which games) because were made obsolete by the subsequent POPS patches. |
|                     | LibCrypt code for Jackie Chan Stuntmaster (PAL)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | With this game in its first batch of discs it has been discovered that it lacks the LibCrypt protection. So if the LibCrypt code built into the POPstarter or the                                                                                                                                                                                                                                                                                                                                                |
